TX6A Shielded Modular Plug
T568B & T568A
Part Number: SPS6X88-C

INSTALLATION INSTRUCTIONS

Specifications

- Cable jacket diameter maximum 0.300 in (7.6mm).
- Solid or stranded conductor maximum insulated diameter 0.047 in (1.2mm).
- Panduit recommends T568B wiring scheme for use with cable constructed with the brown pair opposing the orange pair.
- For use with F/UTP, U/FTP and S/FTP type cables, which meet the dimensional requirements. Cable must have drain wire or braid.

1. Thread on boot and collar first!
   (Cable ends 1 & 2)

2. Align the conductor divider “V” channel with the green pair.
   Insert divider posts into the cable. If the cable has an internal spline, insert divider posts into the brown and orange quadrants of the spline.

3. Arrange conductors to T568B wiring scheme while minimizing untwist.
   Seat conductors into proper divider slots while holding divider flush with cable jacket.

T568A Wiring Scheme

Specifications
- Cable jacket diameter maximum 0.300 in (7.6mm).
- Solid or stranded conductor maximum insulated diameter 0.047 in (1.2mm).
- Panduit recommends T568A wiring scheme for use with cable constructed with the brown pair opposing the green pair.
- For use with F/UTP, U/FTP and S/FTP type cables, which meet the dimensional requirements. Cable must have drain wire or braid.

1. Thread on boot and collar first!
   (Cable ends 1 & 2)
   - Thread boot and collar onto cable.
   - Remove 1.5” of the outer jacket from the cable end using wire stripping tool (CJAST).
   - Cut foil flush with cable jacket end. If cable is braided, form into a drain wire. Bend the drain wire back so it is against the cable jacket.
   - Fan twisted pairs into respective quadrants. The brown pair should be opposite the green pair.
   - When a cable spline (X-shaped filler) is present, cut spline flush to fanned pairs using wire snipping tool (CWST).

2. (Cable end 1)
   (Cable end 2)
   - The “V” channel should be aligned with the orange pair.
   - Insert divider posts into the cable. If the cable has an internal spline, insert divider posts into the brown and green quadrants of the spline.

3. Arrange conductors to T568A wiring scheme while minimizing untwist.
   - Seat conductors into proper divider slots while holding divider flush with cable jacket.
4
- Straighten and align untwisted conductors using a circular motion while holding conductors in respective divider slots.
- Maintain grip of conductors in T568A wiring scheme.
- Trim conductors on an angle approximately 1.00" from divider leading edge.

5
- Orient load bar with contact slots facing downward.

6
- Guide conductors into load bar holes while holding conductors in the divider.
- Slide load bar towards divider until flush.
- Ensure the divider/load bar is centered and perpendicular to the cable axis.
- Trim conductors flush with load bar face.

7
- Hold the load bar and divider stationary while sliding the strain relief collar forward until there is no gap between the collar and divider.
- Ensure the drain wire is routed through the strain collar guides.
- Confirm the cable jacket extends beyond the collar barbs.
- Align pin #1 of cable sub-assembly (cable, load bar, divider, and strain relief collar) with pin #1 of plug housing.

8
- Grip the strain relief collar and insert cable sub-assembly into the plug housing. (Fig. 9)
- Push sub-assembly into housing until collar locking tabs engage the plug housing pocket. Although not required, TX6 PLUS Plug Assembly Tool (CSPT) is available to facilitate this step.
- Use tool MPT5-8AS to complete plug termination. (Fig. 10)
- Trim or press excess drain wire between the collar latches.
- Push up boot and engage with collar latches.
- Visually check plug. Assembly is complete.
